CSE 'A'.

(1) Define SSL and explain its role in web communication?

(2) List and describe any three types of security attacks?

(1) Ans) SSL (Secure sockets layer) is a standard security protocol for establishing encrypted link b/w a web server and a web browser in an online communication.

Role of SSL in web communication:

Data encryption: SSL encrypts the data transmitted b/w the client and server, making it unreadable to unauthorized users.

Authentication: SSL certificates verify that identity of the website, ensuring users are connecting to a legitimate site.

Data Integrity: SSL ensures that data is not altered during transmission without being detected.

Trust & Security: websites using SSL display "HTTPS" and often a padlock icon, indicating secure communication and building user trust.

(2) Ans)

1) Phishing attack:

- Description: involves tricking users into revealing sensitive information by pretending to be a trustworthy entity. often via email or fake websites

Example: A fake bank email asking users to verify their account by entering login credentials on a fake site.

2) Denial of Service (DOS) Attack:-

Description: overwhelms a server, network or service with excessive traffic to make it unavailable to legitimate users.

3) Man-in the middle (MITM) Attack:-

Description: An attacker secretly intercepts and possibly alters the communication b/w two parties without them knowing.

examples: Eavesdropping on data transmitted over an unsecured wi-Fi network.
